How Verify works

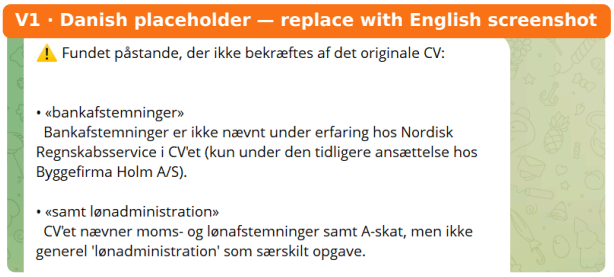

AI that doesn't just write the application — it checks it itself before you see it. A real example: an application for a bookkeeper position at Nordisk Regnskabsservice.

---

1 · FACT CHECK

No invented experience

Before anything is shown, the AI compares every single claim in the application with your real CV. Here it caught two claims that were not in the CV under the current position.

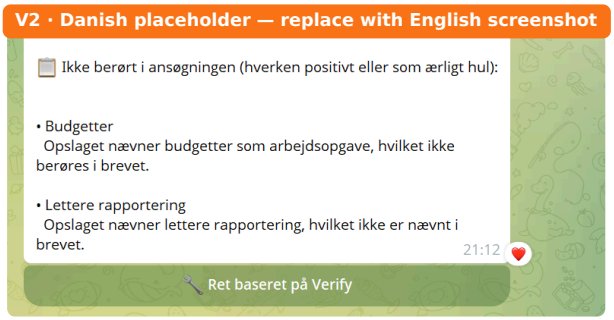

Real Verify result: «bank reconciliations» and «as well as payroll administration» not confirmed by the CV

2 · COVERAGE CHECK

Finds what's missing

At the same time, the AI compares the application with the job posting itself and flags every important requirement that is neither mentioned as experience nor honestly acknowledged as a gap. Same real result, same message — two requirements from the posting were not addressed in the letter at all.

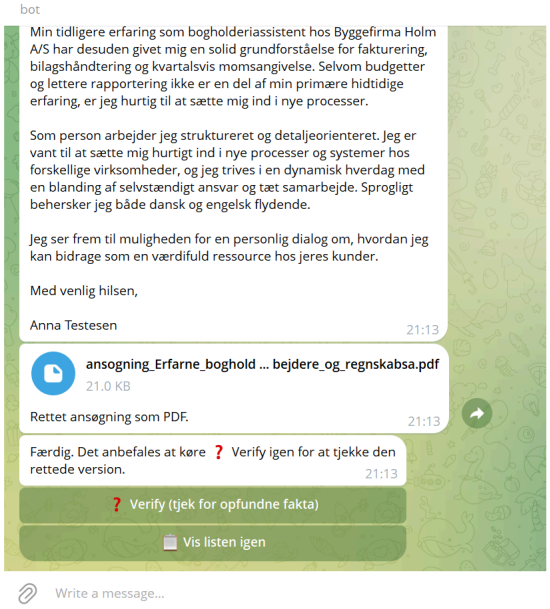

Same real Verify result: "Budgets" and "Light reporting" not addressed in the application

3 · FIX BASED ON VERIFY

Only what is actually wrong

A single click fixes exactly the points Verify found — nothing else is rewritten. The bot immediately generates an updated application as a PDF. In this case it took two rounds: the first fix solved most of the points, but a new Verify check still found one requirement ("Payroll administration and HR-related tasks"), which was fixed in another round.

V3 · Danish placeholder — replace with English screenshot

Real result: corrected application delivered as a PDF, ready for a new Verify check

4 · FINAL CHECK

Submit with confidence

After the second fix, Verify runs again — now on the updated version. Only when everything is confirmed by your CV and all requirements in the job posting are addressed do you get a clean "passed".

V4 · Danish placeholder — replace with English screenshot

Real result: "Check passed" — everything confirmed, all requirements addressed

---

The goal is not to trust AI. The goal is to verify AI.
